

Name _____

Stocking the Student Store

The student store sells school supplies, hats, and T-shirts with the school name printed on them. At the end of each month an inventory is taken to find out what needs to be ordered. The person who counted the hats and T-shirts cannot remember exactly how many of each there were, but he does remember two facts:

There were four times as many T-shirts as hats.
There were 54 more T-shirts than hats.

"No problem!" you tell him, "With this information I can figure out how many T-shirts and how many hats were in the store." What's the answer? _____
